Coolant Flow Radiator And Engine Block Below is an explanation of this system's operation The Thermostat Just like your body needs to warm up when you begin to exercise, your car's engine needs to warm up when it starts its exercise. The thermostat provides control for your engine's warm-up period.

Types of Systems. Coolant flows through the engine in one of the following ways. Parallel flow system. In the parallel flow system, coolant flows into the block under pressure and then crosses the head gasket to the head through main coolant passages beside each cylinder. Series flow system.

When the engine warms up, the wax melts, expands and pushes the valve open, allowing coolant to flow through the radiator. When the engine stops and cools, the valve closes again. Water expands when it freezes, and if the water in an engine freezes it can burst the block or radiator.

Hi No the water pump circulates the coolant the in engine block is separated from the cylinder head when the engine is cold. the water circulates around the radiator slowly by convection. till the thermostat opens due to the coolant in the cylinder head reaching a higher temperature. this allows the coolant to flow around the whole of the cooling system.

Effects of Radiator Design on the Cooling System. A cooling system whose heat load and coolant flow rate results in a 10 degree F coolant temperature drop through the radiator will have that same coolant temperature drop w. hether the radiator has a very small face area and flat fins or a very large face area and louvered fins.

**Motor Coolant Flow Design for Engine Cooling**

the coolant flows from the top of the radiator to the bottom of the radiator, and flows through the bottom rad hose into the engine and gets pumped through from the water pump and up to the thermostat, which regulates how much coolant flows through the engine by heat which helps regulate engine temp to a certain point. then it flows back to the ...

This gives the relative heath of the water pump. The most common cause of poor flow in a Subaru is air trapped in the engine block. I would flow test the radiator and visually inspect the radiator interior. The flow tests is not very helpful. A radiator can flow great but not transfer heat if it is fouled with coolant scale deposits.

The thermostat is simply a valve that measures the temperature of the coolant and, if it is hot enough, opens to allow the coolant to flow through the radiator. If the coolant is not hot enough, the flow to the radiator is blocked and fluid is directed to a bypass system that allows the coolant to return directly back to the engine.

From the cylinder heads, the coolant is then forced to the thermostat. The flow of coolant will either be stopped at the thermostat until the engine is warmed, or it will flow through the thermostat and into the radiator where it is cooled and the coolant cycle is completed.

**Coolant Flow Direction - Is1.com**

Once the coolant reaches the thermostat's activation temperature, it opens, allowing water to flow through the radiator to prevent the temperature rising higher. Once at optimum temperature, the thermostat controls the flow of engine coolant to the radiator so that the engine continues to

operate at optimum temperature.

The radiator is the most prominent part of the system. Coolant that has traveled through the engine is pumped through the tubes of the radiator and is cooled off for another round. The radiator has many channels on the inside so that the coolant travels all over the place, dissipating heat at every turn.

At low temperatures, the outlet to the radiator is completely blocked -- all of the coolant is recirculated back through the engine. Once the temperature of the coolant rises to between 180 and 195 F (82 - 91 C), the thermostat starts to open, allowing fluid to flow through the radiator.

Cooling System Flow: Oil Cooler • Coolant is directed out of the crankcase and into the oil filter base at the front of the engine. • The oil filter base routes the coolant down into the front of the oil cooler then toward the rear of the engine. • Once the coolant has passed through the oil cooler it is routed
