No chemical reaction is a chemical reaction without both of these components. Introduction to Chemical Equations. On paper, a chemical reaction can be written out in the form of a chemical equation, which shows the reaction taking place. Of course there is always a way to describe the reaction in words too.

A chemical symbol is a one or two letter symbol used to refer to any element listed in the Periodic Table. They are used not just because they are 'shortcut' ways of writing the element's name, but because the chemical symbol of separate elements can be combined to make chemical formulae.

The reason this happens is because different chemical compounds have different properties that we can see when that chemical is produced. For example a color change from brown to colorless might mean a reactant chemical that is brown is being converted into a product that is colorless. There are two ways to write that a reaction is taking place:

Introduction. A common atom contains a nucleus composed of protons and neutrons, with electrons in certain energy levels revolving around the nucleus. In this section, the main focus will be on these electrons. Elements are distinguishable from each other due to their "electron cloud," or the area where electrons move around the nucleus of an atom.

Introduction to Chemical Thermodynamics Jessie A. Key. You have previously learned about energy and its relationship to chemical processes (enthalpy). There are some processes that require the input of heat (endothermic) while others release heat (exothermic), but how do we know if any of these processes will proceed under certain conditions?

Introduction Chemical reactions involve the making and breaking of bonds. It is essential that we know what bonds are before we can understand any chemical reaction. To understand bonds, we will first describe several of their properties. The bond strength tells us how hard it is to break a bond.
