Discrete Time Controller Let's see what happens to the overall system when a discrete time proportional control $u(kT) = K_p(r(kT) - x(kT))$ is added. Remember, our plant is still described by a linear differential equation (1) but now we are sensing the plant output at discrete time intervals, and changing the output at discrete intervals. We

Discrete time control systems. Operational amplifier 1 is an input amplifier with a high input impedance. Operational amplifier 2 is the output amplifier; it buffers the voltage on the hold capacitor. There are two modes of operation for a sample-and-hold circuit: the tracking mode and the hold

mode.
