Evaluation of Definite Integrals by Substitution. Consider a definite integral of the following form. Step 1 Substitute  $g(x) = t \Rightarrow g'(x) dx = dt$ . Step 2 Find the limits of integration in new system of variable i.e.. the lower limit is  $g(a)$  and the upper limit is  $g(b)$  and the  $g(b)$  integral is now

•We can use substitution in definite integrals. •However, the limits are in terms of the original variable. •We get two approaches: -Solve an indefinite integral first -Change the limits First solve an indefinite integral to find an antiderivative. Then use that antiderivative to solve the definite integral.

In this section we will take a look at the second part of the Fundamental Theorem of Calculus. This will show us how we compute definite integrals without using (the often very unpleasant) definition. The examples in this section can all be done with a basic knowledge of indefinite integrals and will not require the use of the substitution rule.

It'll become more obvious when we study the definite integral and areas under curves and taking sums of rectangles in order to approximate the area of the curve. Here, it really should just be viewed as a notation for antiderivative. And this notation right over here, this whole expression, is called the indefinite integral of  $2x$ , which is ...
