Development of patterns from sheet materials. Many articles such as cans, pipes, elbows, boxes, ducting, hoppers, etc. are manufactured from thin sheet materials. Generally a template is produced from an orthographic drawing when small quantities are required (larger quantities may justify the use of press tools),...

In the development, all the elements of the figure become radial lines that have the vertex as their origin. The cone is positioned such that one element lies on the development plane. The cone is then unrolled until it is flat on the development plane. One end of all the elements is at the vertex of the cone.

Triangulation. In trigonometry and geometry, triangulation is the process of determining the location of a point by forming triangles to it from known points. Specifically in surveying, triangulation per se involves only angle measurements, rather than measuring distances to the point directly as in trilateration;

8.21 Developments. A development is a flat representation or pattern that when folded together creates a 3-D object. Sheet-metal construction is the most common application for developments and intersections. The resulting flat pattern gives the true size of each connected area of the form so that the part or structure can be fabricated.

TRIANGULAR DEVELOPMENT. An example of layout using triangulation is the development of a transition piece. The steps in the triangulation of a warped transition piece joining a large, square duct and a small, round duct are shown in figure 2-53. The steps are as follows: 1. Draw the top and front orthographic views (view A, fig. 2-53).
